

ZAYNOR Forensic Report — NITROBA

Overview — what kind of incident this is

Classification: SUSPICION — no ATT&CK; technique corroborated

Confidence: UNKNOWN

Result SHA-256: 434cf0a51eaa0649e7a78a8941dfe4d3d6c9ce16c99b403c706e03889cb9089b

Engine: vigia_agent 1.0.0-SANS-2026

Findings / Unknowns: 1 / 0

Agents in this pipeline

Role	Status	What it actually does
MENTOR	conectado	Explains an already-sealed result; never re-invokes VIGIA.
INVESTIGATOR	conectado	collect_window/verify_custody call VIGIA's MCP bridge for real.
FLEET_COMMANDER	conectado	Writes to the investigation log; never produces a verdict.
DETECTION_ENGINEER	conectado	draft_sigma_rule anchors candidates to a real sealed finding.
DISPATCHER	conectado	Catalog of evidence types Mode 1 can actually analyze.
ENDPOINT_HUNTER / PERSISTENCE_HUNTER	out of scope	Would need a live EDR collection backend this project does not have.
THREAT_INTEL	out of scope, for now	A portable VirusTotal/GTI enrichment exists but is not wired in — external network dependency, pending decision.

Findings come from VIGIA's deterministic Mode 1 engine, not from a named agent above -- no per-finding agent attribution exists in the sealed contract.

Findings

Finding	State	MITRE	Detected by	Rationale
F-NITROBA	SUSPICION	-	VIGIA Mode 1	[MOTOR] Label-blind selection: SUSPICION_DETECTED. Significant signal with structural support (score=0.3135)

Unknowns

- None declared.

Chain of custody

Methodology

The deterministic engine produces and seals the result before any language model is invoked. The model receives a compressed, read-only summary and narrates it; it cannot alter a verdict, a finding, or the seal. Every claim in a narration is checked against this sealed result before being shown (zaynor chat/serve). result_sha256 is the canonical SHA-256 seal of the authoritative result:

recompute it independently with `zaynor audit` to confirm this report was not altered after the fact.
